Embedded Debian supports reducing Debian down to be suitable for much smaller systems whilst keeping the multiarchitecture support, vendor independence, social contract and huge software base.

- Emdebian 1.0 will be based on Debian 5.0 "Lenny"
- Lenny already contains the build tools for Emdebian which allow Debian source packages to be cross-built and shrunk to suit embedded ARM systems.

The Emdebian 1.0 distribution itself will contain prebuilt ARM packages sufficient to create root filesystems that can be customised for specific machines and machine variants. Kernels and kernel modules need to be provided separately. Support for armel and i386 is pending.

Embedded Debian supports reducing Debian down to be suitable for much smaller systems whilst keeping the multiarchitecture support, vendor independence, social contract and huge software base.

- Emdebian 1.0 will be based on Debian 5.0 "Lenny"
- Lenny already contains the build tools for Emdebian which allow Debian source packages to be cross-built and shrunk to suit embedded ARM systems.

The Emdebian 1.0 distribution itself will contain prebuilt ARM packages sufficient to create root filesystems that can be customised for specific machines and machine variants. Kernels and kernel modules need to be provided separately. Support for armel and i386 is pending.

- Full control of dependencies on small systems (some modified dependencies). Remove perl and remove or reimplement required perl scripts. Remove documentation.

Build = Big or build == Desktop

Host == Handheld

- Toolchains for installation on i386, amd64 build machines.

Build = Big or build == Desktop

Host == Handheld

- Toolchains for installation on i386, amd64 build machines.
- To build for arm, armel, ia64, m68k, mips, mipsel, powerpc and sparc host machines.

Build = Big or build == Desktop

- Current method uses debootstrap, other backends are possible.
- (Second stage of normal debootstrap requires a working cross compiler to work without perl.)
- 'Unpack' method in development to create a filesystem image without .deb files. Only needs minor configuration on the device.

- Current method uses debootstrap, other backends are possible.
- (Second stage of normal debootstrap requires a working cross compiler to work without perl.)
- 'Unpack' method in development to create a filesystem image without .deb files. Only needs minor configuration on the device.
- '--machine foo' for general changes (default variant)

- Current method uses debootstrap, other backends are possible.
- (Second stage of normal debootstrap requires a working cross compiler to work without perl.)
- 'Unpack' method in development to create a filesystem image without .deb files. Only needs minor configuration on the device.
- '--machine foo' for general changes (default variant)
- '--machine foo' '--variant code' for other derivations.

- Current method uses debootstrap, other backends are possible.
- (Second stage of normal debootstrap requires a working cross compiler to work without perl.)
- 'Unpack' method in development to create a filesystem image without .deb files. Only needs minor configuration on the device.
- '--machine foo' for general changes (default variant)
- '--machine foo' '--variant code' for other derivations.
- Customised package selection with no fixed package sets - select anything that works.

- Current method uses debootstrap, other backends are possible.
- (Second stage of normal debootstrap requires a working cross compiler to work without perl.)
- 'Unpack' method in development to create a filesystem image without .deb files. Only needs minor configuration on the device.
- '--machine foo' for general changes (default variant)
- '--machine foo' '--variant code' for other derivations.
- Customised package selection with no fixed package sets - select anything that works.
- Example full GPE GUI filesystem 25Mb compressed, about 75Mb installed. (Work is ongoing to drop below 64Mb installed.)

- Embedded devices need customised kernels and kernel modules.

- Embedded devices need customised kernels and kernel modules.
- Installation methods are often specific to that device or device type and might not fit with typical D-I setup.
- Emdebian is investigating D-I support with a pre-built root filesystem tarball - just needs to be unpacked and run
`# dpkg --configure -a`

- Embedded devices need customised kernels and kernel modules.
- Installation methods are often specific to that device or device type and might not fit with typical D-I setup.
- Emdebian is investigating D-I support with a pre-built root filesystem tarball - just needs to be unpacked and run
`# dpkg --configure -a`
- Example: (balloon3)
boot flash (bootloader support on RO partition)
mount USB stick and the root partition.
Copy over the kernel image.
Untar the root filesystem directly onto the root partition
chroot into root filesystem, `dpkg --configure -a`
untar kernel modules
reboot

- Dependencies will differ.
